When the terminal draws the wrong thing

Press **⌘⇧R** (`Ctrl+Shift+R`) while the wrong thing is on screen. Two files land at the top of your home folder:

```
starling-terminal-report-20260819-103759.txt
starling-terminal-report-20260819-103759.png
```

Attach both to the issue. The `.txt` says what the terminal believed was on screen, along with the fonts it loaded, the size of its cells and which glyph path drew them; the `.png` is that same frame as it was painted, recorded inside the terminal rather than captured from the display.

The pair is what makes a rendering bug fixable, because between them they say *which half* is wrong — text right and picture wrong is a drawing bug, text already wrong is not. A photograph of the screen cannot distinguish those, and almost every such report arrives as a photograph.

The `.txt` includes the text that was on your screen when you pressed the chord (scrollback is not included). Read it before you attach it.

One thing worth trying first, and worth saying in the issue either way: start the terminal with `STARLING_TERM_ATLAS=0`. That swaps the whole glyph-drawing path for an older one kept for exactly this comparison. If it fixes what you are seeing, that halves the search.
