Publish documents, not web pages

Every page on this site is a Word document, stored in a git repository and drawn here by Starling Writer. What you see is what prints. A text view in plain HTML stands in while the reader loads, for screen readers and crawlers, and for anyone who prefers it: the Read text button.

What a page can do that a web page cannot

- Real pages, with headers, footers and page numbers, on a desktop; the same document reflowed on a phone.
- A table of contents whose entries carry page numbers, and a link to any paragraph.
- Tables that run across pages, footnotes at the foot of the page, Word's own typography.
- A PDF that is the same painter: the pages you read are the pages you print.

How it is made

Authors edit in Starling Writer, with its full ribbon, on a clone of the repository. Publish builds this folder, commits and pushes; GitHub Pages serves it. There is no server, no sign-in and no build toolchain.

Open "Published documents" for three real documents: a 24-page security policy with footnotes and two NIST documents, one with 81 headings and a table of contents, one with 778 table cells.
